                                                                                                                        autoimmune haemolytic anaemia, Hughe's syndrome and lupoid thrombocytopaenia. The TMP of the invention is also useful for maintaining the viability or storage life of platelets and/or megakaryocytes and its derived cells. The compounds demonstrate an improved ability to bind to and/or trigger transmembrane signal through, i.e. activating, the mpl receptor the compounds have superior thromobopoietic activity, i.e. the ability to stimulate, in vivo and in vitro, the production of platelets and/or megakaryocytopoietic activity, i.e. the ability to stimulate, in vivo and in vitro, the production of platelets and/or megakaryocytopoietic activity, i.e. the ability to stimulate, in vivo and in vitro, the production of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          thrombocytopaenia in an animal, and for increasing megakaryocytes or platelets in a patient. The TMP of the invention is useful for treating conditions involving a megakaryocyte and/or platelet deficiency, e.g. disease conditions involving thrombocytopaenia such as aplastic anaemia, autoimmune thrombocytopaenia, drug induced immune thrombocytopaenia, autoimmune becomplished.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to a thrombopoietin mimetic peptide (TMP) (I) that binds to the c-mpl (mpl) receptor, and which stimulates the production of platelets and/or the production of platelet precursors, is new. Further disclosed is a composition of matter (II) that binds to an mpl receptor, and a pharmaceutical composition comprising (II) and a carrier. The pharmaceutical composition of the invention is useful for treating that the pharmaceutical composition of the invention is useful for treating that the pharmaceutical composition of the invention is useful for treating the pharmaceutical composition of the invention is useful for treating the pharmaceutical composition of the invention is useful for treating the pharmaceutical composition of the invention is useful for treating the pharmaceutical composition of the invention is useful for treating the pharmaceutical composition of the invention is useful for treating the production of the production of the production of the production of the production of the production of the production of the production of the production of the production of the production of the production of the production of the production of the production of the production of the production of the production of the production of the production of the production of the production of the production of the production of the production of the production of the production of the production of the production of the production of the production of the production of the production of the production of the production of the production of the production of the production of the production of the production of the production of the production of the production of the production of the production of the production of the production of the production of the production of the production of the production of the production of the production of the production of the production of the production of the production of the production of the production of the production of the production of the production
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Haemostatic; antianaemic; immunosuppressive; platelet; transmembrane signaling; mpl receptor; thrombospoietin mimetic peptide; TMP; c-mpl receptor; platelet precursor; megakaryocyte; thrombocytopaenia; aplastic anaemia; autoimmune thrombocytopaenia; autoimmune haemolytic anaemia; Hughe's syndrome;
platelet precursors. Further, certain of the compounds also exhibit superior therapeutic properties, such as improved plasma half-life, biological activity and in vivo circulation time. The current seque
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Novel thrombopoietin mimetic peptides which bind to mpl receptor, which stimulate the production of platelets and/or the production
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      11-OCT-2001; 2001US-0328666P

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         片
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           á
The invention relates to a thrombopoietin mimetic peptide (TMP) (I) that CC binds to the c-mpl (mpl) receptor, and which stimulates the production of CC platelets and/or the production of platelet precursors, is new. Further CC disclosed is a composition of matter (II) that binds to an mpl receptor, and a pharmaceutical composition comprising (II) and a carrier. The CC platelets in an animal, and for increasing megakarycytes or CC platelets in a patient. The TMP of the invention is useful for treating CC conditions involving a megakarycyte and/or platelet deficiency, e.g. CC disease conditions involving thrombocytopaenia such as aplastic anaemia, CC autoimmune thrombocytopaenia, drug induced immune thrombocytopaenia, Hughe's syndrome and lupoid thrombooytopaenia. The TMP of the invention is also useful for megakarycytes and its derived cells. The compounds demonstrate an improved ability to bind to and/or trigger transmembrane signal through, i.e. activating, the mpl receptor the compounds have superior and in

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       vitro, the production of platelets and/or megakaryocytopoietic activite. the ability to stimulate, in vivo and in vitro, the production platelet precursors. Further, certain of the compounds also exhibit superior therapeutic properties, such as improved plasma half-life, biological activity and in vivo circulation time. The current sequen represents a TMP fragment.
A compound which binds to an mpl receptor comprising a thrombopoietin mimetic peptide (TMP) dimer joined by a linker [TMP] 1-(L, 1) nTMP 2], is new. TMP1 and TMP2 are amino acid sequences varying from at least 10 to 14 residues in length comprising x 2-x 1 0, x 2-x 1 1, x 2-x 1 2, x 2-x 1 3, x 2-x 1 4, x 1-x 1 0, x 1-x 1 7, x 1-x 1 2, x 2-x 1 2, x 2-x 1 2, x 2-x 1 4, x 1 - x 1 0, x 1-x 1 1, x 1 - x 1 2, x 1 1 2, x 1 2, x 1 2, x 1 2, x 1 2, x 1 3, and x 1 2, x 1 4, x 1 1 1, x 1 2, x 1 2 1, x 1 2 1, x 1 2 1, x 1 3, and x 1 2, x 1 3, x 1 2, x 1 3, and x 1 3, x 1 3, x 1 3, x 1 3, x 1 3, x 1 1, x 1 3, x 1 1, x 1, x 1 1, x 1 1, x 1 1, x 1 1, x 1 1, x 1 1, x 1 1, x 1 1, x 1 1, x 1 1, x 1 1, x 1 1, x 1 1, x 1 1, x 1 1, x 1 1, x 1 1, x 1 1, x 1 1, x 1 1, x 1 1, x 1 1, x 1 1, x 1 1, x 1 1, x 1 1, x 1 1, x 1 1, x 1 1, x 1 1, x 1 1, x 1 1, x 1 1, x 1 1, x 1 1, x 1 1, x 1 1, x 1 1, x 1 1, x 1 1, x 1 1, x 1 1, x 1 1, x 1 1, x 1 1, x 1 1, x 1 1, x 1 1, x 1 1, x 1 1, x 1 1, x 1 1, x 1 1, x 1 1, x 1 1, x 1 1, x 1 1, x 1 1, x 1 1, x 1 1, x 1 1, x 1 1, x 1 1, x 1 1, x 1 1, x 1 1, x 1 1, x 1 1, x 1 1, x 1 1, x 1 1, x 1 1, x 1 1, x 1 1, x 1 1, x 1 1, x 1 1, x 1 1, x 1 1, x 1 1, x 1 1, x 1 1, x 1 1, x 1 1, x 1 1, x 1 1, x 1 1, x 1 1, x 1 1, x 1 1, x 1 1, x 1 1, x 1 1, x 1 1, x 1 1, x 1 1, x 1 1, x 1 1, x 1 1, x 1 1, x 1 1, x 1 1, x 1 1, x 1 1, x 1 1, x 1 1, x 1 1, x 1 1, x 1 1, x 1 1, x 1 1, x 1 1, x 1 1, x 1 1, x 1 1, x 1 1, x 1 1, x 1 1, x 1, x 1 1, x 1 1, x 1 1, x 1 1, x 1 1, x 1 1, x 1 1, x 1 1, x 1 1, x 1 1, x 1 1, x 1 1, x 1 1, x 1 1, x 1 1, x 1 1, x 1 1, x 1 1, x 1 1, x 1 1, x 1 1, x 1 1, x 1 1, x 1 1, x 1 1, x 1 1, x 1 1, x 1 1, x 1 1, x 1 1, x 1 1, x 1 1, x 1 1, x 1 1, x 1 1, x 1 1, x 1
                                                                                                                                                                                                                                                                     Thrombopoietic peptides which activate mpl receptors and increase production of platelets or platelet precursors, useful for treatmediseases which involve thombocytopenia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence

The present invention describes composition of matter (I) comprising an Fc domain, pharmacologically active peptides, and linkers. Where (I) is: (X1)aF1-(X2)b, where: F1 = an Fc domain; X1 and X2 = are each independently selected from -(L1)c-P1, -(L1)c-P2-(L2)d-P2, -(L1)c-P1-(L2)d-P2-(L3)e-P3, or -(L1)c-P1-(L2)d-P2-(L3)e-P3-(L4)f-P4 where P1, P2, P3, and P4 = are each independently sequences of pharmacologically active peptides; L1, L2, L3, and L4 = are each independently linkers; and a, b, c, d, e, and f = are each independently 0 or 1, provided that at least 1 of a and b is 1. The composition can have cytostatic, antiasthmatic, thrombolytic and immunosuppressive activities. DNAs, vectors and host cells from the present invention can be used for producing pharmaceutical compositions. The compositions are useful for treating cancer, asthma, thrombosis, or autoimmune diseases. The use of an Fc domain (rather than
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          auroimmune disease; cytostatic; antiasthmatic; thrombolytic; VEGF; immunosuppressive; EPO; TPO; CTLA4; mimetic; IL-1; TNF; antagonist; MMP; inhibitor; erythropoietin; thrombopoietin; interleukin 1; cytotoxic T cell lymphocyte antigen 4; tumour necrosis factor; vascular endothelial growth factor; matrix metalloproteinase; asthma; thrombogis: pharmacoutical
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 N, Q or G; X 1_4 = A, I, V, L, F, T, R, E, or G; L_1 = linker comprising 1 to 20 amino acids, and n = 0 or 1. The compounds bind to and activate the c-Mp1 receptor which mediates the activity of endogenous thrombopoietin. The TMPs are useful for increasing the production of platelets or platelet precursors (e.g. megakaryocytes) in a mammal, which is useful for treatment of diseases which involve thombocytopenia, e.g. aplastic anaemia, immune thrombocytopenia (ITP), human immunodeficiency virus associated ITP, and systemic lupus erythematosus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        23-OCT-1998;

       The present invention describes an immunoglobin molecule or its fragment ((1) comprising a region where amino acid residues corresponding to at least a portion of the complementary determining region (CDR) are replaced or fused with biologically active peptides e.g. a peptide mimetic such as an erythropoietin (EPO) or thrombopoietin (TPO) mimetic, that is flanked with proline at its carboxy terminus (I) has attianaemic, haemostatic and nephrotropic activities, and can be used as a stimulator of proliferation, differentiation and maturation of haematopoietic cells, and a stimulator of proliferation, differentiation or growth of for stimulating proliferation, differentiation or growth of promegakaryocytes or megakaryocytes, where (I) is contacted with corresponding to a portion of CDR is replaced with an EPO mimetic, or which has one or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Query Match

                         The present invention describes an immunoglobin molecule or its fragment (I) comprising a region where amino acid residues corresponding to at least a portion of the complementary determining region (CDR) are replaced or fused with biologically active peptides e.g. a peptide mimetic such as an erythropoietin (EPO) or thrombopoietin (TPO) mimetic, that is flanked with proline at its carboxy terminus. (I) has antianaemic, haemostatic and nephrotropic activities, and can be used as a stimulator of proliferation, differentiation and maturation of haematopoietic cells, and a stimulator of haematopoiesis. (I) is useful for stimulating proliferation, differentiation or growth of promegakaryocytes or megakaryocytes, where (I) is contacted with promegakaryocytes or megakaryocytes, which results in increased platelet production. (I) with a region where amino acid residues corresponding to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      production of red blood cells, where (I) is contacted with haematopoietic stem cells or their progenitors. (I) is useful for diagnostics or therapeutics, in cell isolation strategies, and for treating patients suffering from deficiency in cell populations caused by disease, disorders or treatments related to the suppression of haematopoiesis. ABQ73288 to ABQ73377 and ABP51669 to ABP51696 represent sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                A novel immunogen molecule comprising a region in which amino acid residues corresponding to at least a portion of the complementary determining region are replaced or fused with an erythropoietin or thrombopoetin mimetic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               05-DEC-2000; 2000US-0251448P.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           more of its CDRs fused to an EPO mimetic, is useful for increasing the production of red blood cells, where (I) is contacted with haematopoietic stem cells or their progenitors. (I) is useful for diagnostics or therapeutics, in cell isolation strategies, and for treating patients suffering from deficiency in cell populations caused by disease, disorders or treatments related to the suppression of haematopoiesis. ABQ73288 to ABQ73377 and ABP51669 to ABP51696 represent sequences used in the exemplification of the present invention
(I) comprising a region where amino acid residues corresponding to at least a portion of the complementary determining region (CDR) are replaced or fused with biologically active peptides e.g. a peptide mimetic such as an erythropoletin (EPO) or thrombopoletin (TPO) mimetic, that is flanked with proline at its carboxy terminus. (I) has antianaemic, haemostatic and nephrotropic activities, and can be used as a stimulator of proliferation, differentiation and maturation of haematopoletic cells, and a stimulator of haematopolesis. (I) is useful for stimulating proliferation, differentiation or growth of promegakaryocytes or megakaryocytes, where (I) is contacted with promegakaryocytes or megakaryocytes, which results in increased platelet promediction. (I) with a region where amino acid residues corresponding to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence 18 AA;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Query Match
The invention relates to a novel immunoglobulin molecule or its fragment comprising a region where amino acid residues corresponding to at least a portion of a two complementarity determining regions (CDRs) are replaced with a peptide mimetic selected from an erythropoietin (EPO) mimetic and a thrombopoietin (TPO) mimetic. An immunoglobulin molecule of the invention has immunosuppressive activity, and may have a use in immunotherapy. The immunoglobulin molecule is useful for diagnosing or treating thrombocytopenia as a result of chemotherapy, bone marrow transplantation, or chronic diseases such as idiopathic thrombocytopenia. The present sequence represents a TPO mimetic peptide with flanking
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      a portion of CDR is replaced with an EPO mimetic, or which has one or more of its CDRs fused to an EPO mimetic, is useful for increasing the production of red blood cells, where (I) is contacted with haematopoietic stem cells or their progenitors. (I) is useful for diagnostics or therapeutics, in cell isolation strategies, and for treating patients suffering from deficiency in cell populations caused by disease, disorders or treatments related to the suppression of haematopoiesis. ABQ73288 to ABQ73377 and ABB51669 to ABP51696 represent sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                            New immunoglobulin molecule comprising a region, where two complementarity determining regions (CDRs) are replaced wi or a TPO mimetic, useful for treating thrombocytopenia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        immunoglobulin; complementarity determining region; CDR; peptide mimetic; erythropoietin; EPO; thrombopoietin; TPO; immunosuppressive; immunotherapy; thrombocytopenia.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Best Local Similarity
                                                                                                                                                                                                                                                with a peptide mimetic selected from an erythropoietin (EPO) mimetic and a thrombopoietin (TPO) mimetic. An immunoglobulin molecule of the invention has immunosuppressive activity, and may have a use in immunotherapy. The immunoglobulin molecule is useful for diagnosing or treating thrombocytopenia as a result of chemotherapy, bone marrow transplantation, or chronic diseases such as idiopathic thrombocytopenia. The present sequence represents a TPO mimetic peptide with flanking
                                                                                                                                                                                                                                                                                                                                          The invention relates to a novel immunoglobulin molecule or its fragment comprising a region where amino acid residues corresponding to at least portion of a two complementarity determining regions (CDRs) are replaced
                                                                                                                                                                                                                                                                                                                                                                                                                        New immunoglobulin molecule comprising a region, where two complementarity determining regions (CDRs) are replaced with or a TPO mimetic, useful for treating thrombocytopenia.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to a novel immunoglobulin molecule or its fragment comprising a region where amino acid residues corresponding to at least a portion of a two complementarity determining regions (CDRs) are replaced with a peptide mimetic selected from an erythropoletin (EPO) mimetic and a thrombopoletin (TPO) mimetic. An immunoglobulin molecule of the invention has immunosuppressive activity, and may have a use in immunotherapy. The immunoglobulin molecule is useful for diagnosing or treating thrombocytopenia as a result of chemotherapy, bone marrow transplantation, or chronic diseases such as idiopathic thrombocytopenia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence 18
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New immunoglobulin molecule comprising a region, where two complementarity determining regions (CDRs) are replaced with EPO mimetic

Further CC disclosed is a composition of matter (II) that binds to an mpl receptor, and a pharmaceutical composition of matter (II) that binds to an mpl receptor, and a pharmaceutical composition comprising (II) and a carrier. The CC pharmacocytopaenia in an animal, and for increasing megakaryocytes or CC platelets in a patient. The TMP of the invention is useful for treating CC conditions involving a megakaryocyte and/or platelet deficiency, e.g. CC disease conditions involving thrombocytopaenia such as aplastic anaemia, autoimmune thrombocytopaenia, drug induced immune thrombocytopaenia, autoimmune haemolytic anaemia, Hughe's syndrome and lupoid thrombocytopaenia. The TMP of the invention is also useful for compania megakaryocyte and for megakaryocytes and its derived cells. The compounds demonstrate an compound ability to bind to and/or trigger transmembrane signal through, i.e. activating, the mpl receptor the compounds have superior compounds in the production of platelets and/or megakaryocytopoietic activity, i.e. the ability to stimulate, in vivo and in vitro, the production of platelets and/or megakaryocytopoietic activity, i.e. the ability to stimulate, in vivo and in vitro, the production of platelets and/or megakaryocytopoietic activity, i.e. the ability to stimulate, in vivo and in vitro, the production of platelets and/or megakaryocytopoietic activity, i.e. the ability to stimulate, in vivo and in vitro, the production of platelets and/or megakaryocytopoietic activity, i.e. the ability to stimulate, in vivo and in vitro, the production of platelets and/or megakaryocytopoietic activity and in voico circulation time. The current sequence represents a TMP peptide of the invention to which a two amino acid "cap" has been added to the carboxy terminal to increase peptide affinity.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to a novel immunoglobulin molecule or its fragment comprising a region where amino acid residues corresponding to at least a portion of a two complementarity determining regions (CDRs) are replaced with a peptide mimetic selected from an erythropoietin (EPO) mimetic and a thrombopoietin (TPO) mimetic. An immunoglobulin molecule of the invention has immunosuppressive activity, and may have a use in immunostherapy. The immunoglobulin molecule is useful for diagnosing or treating thrombocytopenia as a result of chemotherapy, bone marrow transplantation, or chronic diseases such as idiopathic thrombocytopenia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         WO2004050017-A2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence 128 AA;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to a novel immunoglobulin molecule or its fragment comprising a region where amino acid residues corresponding to at least a portion of a two complementarity determining regions (CDRs) are replaced with a peptide mimetic selected from an erythropoietin (EPO) mimetic and a thrombopoietin (TPO) mimetic. An immunoglobulin molecule of the invention has immunosuppressive activity, and may have a use in immunotherapy. The immunoglobulin molecule is useful for diagnosing or treating thromborytopenia as a result of chemotherapy, bone marrow transplantation, or chronic diseases such as idiopathic thrombocytopenia. The present sequence represents immunoglobulin clone 116 heavy chain.
                                                                                                            A novel immunogen molecule comprising a region in which amino acid residues corresponding to at least a portion of the complementary determining region are replaced or fused with an erythropoietin or
                                                                                                                                                                                                                                                                 05-DEC-2000; 2000US-0251448P

(I) has CC antianaemic, haemostatic and nephrotropic activities, and can be used as CC a stimulator of proliferation, differentiation and maturation of CC haematopoietic cells, and a stimulator of haematopoiesis. (I) is useful CC promegakaryocytes or megakaryocytes, where (I) is contacted with CC promegakaryocytes or megakaryocytes, which results in increased platelet CC production. (I) with a region where amino acid residues corresponding to CC a portion of CDR is replaced with an EPO mimetic, or which has one or CC more of its CDRs fused to an EPO mimetic, is useful for increasing the CC production of red blood cells, where (I) is contacted with haematopoietic stem cells or their progenitors. (I) is useful for diagnostics or therapeutics, in cell populations caused by disease, CC disorders or treatments related to the suppression of haematopoiesis.
